CONCLUSION

- **India's vaccination campaign achieved large-scale coverage,** with millions of doses administered across all states through thousands of vaccination sessions.

- **Covishield was the most widely used vaccine**, followed by Covaxin, showing clear preference and availability trends.

- The **18–44 age group received the highest number of doses**, as they form the majority of India's working population and were a major target group.

- **State-wise performance varies**,showing that some states conducted more sessions and opened more vaccine centers, leading to better vaccination coverage.

thank you
